SAP SERVICES

Simplification and transformation

From implementing new modules to business unit optimisation and transformation—we analyse and evaluate your processes, working with you to develop a roadmap for the simplification of your SAP landscape.

Restructuring company divisions, new system architecture requirements as well as mergers, divestitures and takeovers all mandate long-term adjustments to business processes. For corporate IT, this means that the SAP landscape must be rapidly and reliably adjusted to accommodate new conditions.

Optimising and simplifying processes and SAP

Standardising and simplifying processes and functions... creating transparency... going digital with more business transactions: the overall aim here is to design your SAP landscape to be as simple and cost-effective as possible—while still covering all of your business requirements.

- We examine your existing processes and how these are mapped to SAP.
- We cut your process costs and improve the quality of your business transactions.
- We apply new SAP functionality to boost your degree of digitalisation.

›Carve-in transformations‹

For takeovers and mergers, your SAP landscapes must be matched up as a minimum—and usually require integration and harmonisation. The aim here is to use existing processes and functions to design the carve-in to be as effective and economical as possible. Customisation work is naturally required to ensure the retention of specific competitive advantages.

SAP SERVICES

Simplification and transformation

- We integrate and transfer your business units and processes in SAP.
- We consolidate organisational units.
- We migrate and harmonise your data.
- We apply new SAP functionality to boost your degree of digitalisation.

›Carve-out transformations‹

If a company divests itself of a unit, SAP landscapes need to be adapted while processes and functions are transferred. The goal here is ensuring the simple and effective separation of both processes as well as shared functions and data.

- We analyse the processes and functions to be spun off.
- We isolate company codes and other organisational units from your existing SAP landscape.
- We excise and extract data.
- We rebuild functions and processes.

SAP S/4HANA

So you've decided to deploy SAP S/4HANA ... What now?

A SAP S/4HANA migration will affect and involve almost every business unit within a business, and is more than just a technical challenge for the company IT department. For many SAP users, switching to SAP S/4HANA is now unavoidable—not least because of SAP's announcement that it will discontinue maintenance and patch releases for the earlier R/3 system in 2027 and 2030.

We work with you to determine the extent of the changes needed for the upcoming system cutover and we develop a roadmap to ensure a smooth transition for your business. Whether you ultimately pick a greenfield or brownfield strategy will be based on our analyses, assessments and the SAP S/4HANA Readiness Check.

Integrium has developed a workshop programme that helps you to find the right approach and the right point in time for your switch to SAP S/4HANA. We work with you to discover whether an on-premise or cloud solution—or a hybrid version of both—should be deployed at your company, while taking into account your business strategy.

For SAP S/4HANA itself, we can provide support in a number of key areas:

- Feasibility studies, benchmarking and technical proofs of concept.
- We assess whether you'd be better served by a greenfield or brownfield approach.
- We prepare clear-cut decision papers for on-premise or managed private cloud operations.
- In a brownfield project, we work with you to migrate your SAP system to S/4HANA.
- We create a made-to-measure 'Roadmap to SAP S/4HANA' to smooth the way to your migration.
- We work with you from start to finish on your greenfield implementation.

GLOBALISATION

International business processes

As markets go global and businesses need to consider the international angle in their activities, there's a growing need for companies to structure and standardise a single business model for the organisation. Subsidiaries (both domestic and foreign) need to be set up, expanded and transformed with very short turnarounds. Newly acquired companies often need to be integrated into the existing business and its IT backend systems at short notice.

This is made harder by business processes with local optimisations, overgrown ERP systems and mix-and-match IT architectures. As a result, regional units, local subsidiaries, factories, sales and service centres all need standardised business processes with site-specific adaptations.

A successful international SAP rollout depends on finding the right balance between global standardisation on the one hand and the freedom to make adjustments to suit regional specifics on the other. Legal and fiscal requirements must also be accommodated at all times.

We help you to set up and roll out your SAP templates, and ensure your SAP systems stay standardised.

We ensure the success of your undertaking with a streamlined and uniform project methodology based on SAP template rollouts, as well as project, quality and change management throughout all of the phases in your project.

Success criteria for your global SAP landscape:

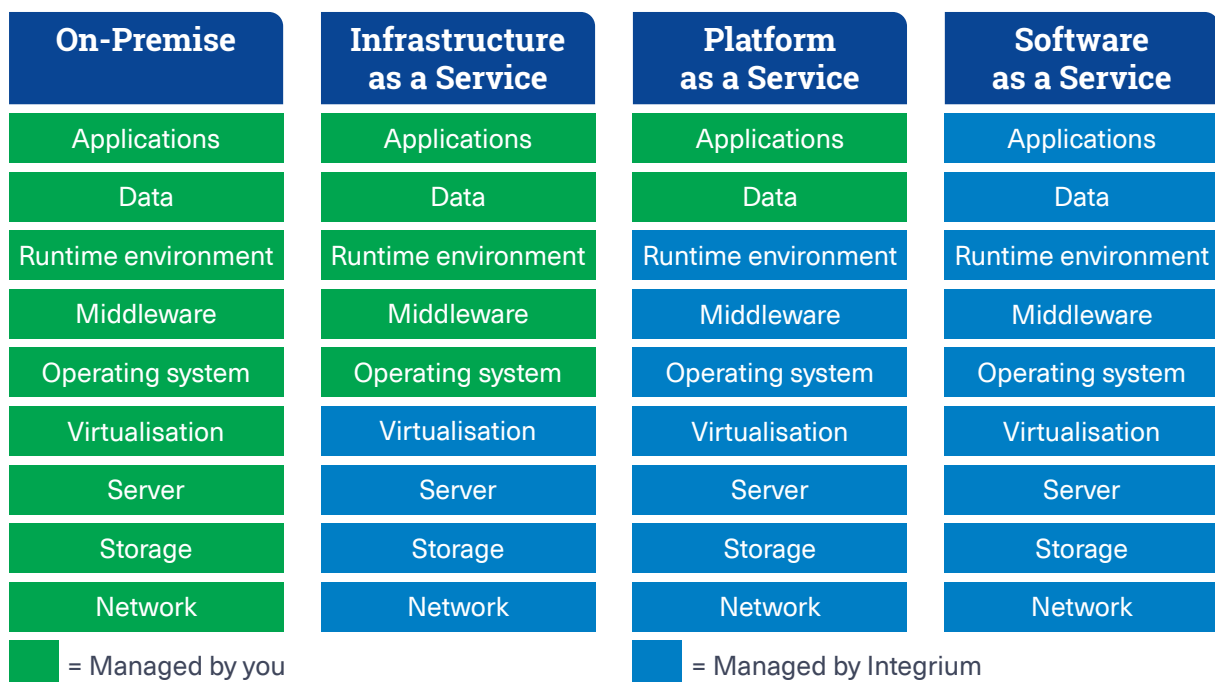

- Application of a global, standardised rollout template for company-wide business processes.
- Best practice solutions for your local requirements.
- On-demand IT service scalability in a managed private cloud.
- Uncomplicated cross-border collaboration.

ADMINISTRATION

SAP Managed Cloud and on-premise services

For many businesses and IT decision-makers, the increasing complexity of system landscapes and rising cost pressure are making it harder to run company systems in house. These problems are worsened by growing demands to provide business and service processes quickly and simply, and to support these with the latest innovations.

Let us handle your workload and make use of our broad-based SAP expertise. With our SAP Managed Cloud and on-premise services, we can take on as just as much responsibility for your SAP landscape as you need.

ADMINISTRATION

SAP Managed Cloud and on-premise services

We work with our data centre partners to provide you with your own enterprise cloud. Infrastructure resources can be provisioned (and then stood down again) at short notice. You benefit from the typical scalability, agility and flexibility found in the cloud—and from the advantages of cloud-based pricing. You enjoy a pay-as-you-go model and don't need to stump up for reserve capacity that you never use.

If needed, we can also provide you with individual SAP services from a public cloud or another dedicated environment: this lets you benefit from even greater flexibility—at the touch of a button, so to speak—while further reducing your costs.

Benefits for your business:

- Stable and highly available SAP system operations with no bottlenecks.
- Defined service levels keep service quality consistent.
- Premium support for your end users.
- Continuous improvements to your application.
- Compliance and security guaranteed by regular technology updates.
- All data centres are based in Germany and conform to German data protection regulations.
- Plannable operating costs with no small print.
- Quick and simple scaling.
- No need to build up in-house expertise.
- Outsourcing of time-consuming routine processes—concentrate your know-how on topics relevant to your business.

INTEGRIVIUM

How to become a simplifier

We'd be the first to agree that SAP isn't exactly famous for being straightforward. At Integrium, however, we've discovered that it's not actually SAP that usually makes a SAP landscape overly complicated. Instead, it's the silo solutions, the custom work, the customisations to this custom work, and then yet more customisations to that—in short, the radical departure from standard SAP.

Sven Böhrnsen (left) and Guido Karl (right)
Managing directors Integrium

These insights inspire and motivate our current team of around 20 consultants and developers, led by our two founders who learnt their trade in SAP from the ground up. Time and again, we find that a solid dose of standard SAP serves the customer's needs far better than elaborate standalone solutions.

To date, this approach has seen us support 140 large-scale projects in 13 countries, plus a host of minor projects for businesses. Topics covered have ranged from the creation of templates plus subsequent rollout to simplifications and improvements in all SAP modules, and as far as S/4HANA transformation strategies and their implementation.
